Identified oxygenated aromatics; M represents the molar mass of the species in g/mol

Examples of chromatograms (middle panel) obtained in the doped anisole flame at 1.5 mm above the burner surface; some mass spectra GC-MS are also presented

Number of oxygenated aromatics with different functional groups; carbonyls include aldehydes and ketones.

Possible formation pathways for some of the selected oxygenated aromatics

## Conclusions and Perspectives

- >60 oxygenated aromatics have been identified in an anisole doped using advanced Gas Chromatography
- More than half of these oxygenates amongst these have been reported for the first time
- Quantification of these aromatic oxygenates is currently an ongoing step
- Simulations will be performed allowing a precise interpretation of the effects of the oxygenated additives
- Other than the gas phase investigation, experiments to probe the particulates in the flames have also been envisioned.
